In graph theory, a **maximum spanning tree** is a subgraph that is a tree and connects all the vertices with maximum weight sum. And a **maximum spanning forest** is the union of maximum spanning trees of each connected component in the graph.

A big undirected graph $G = (V, E)$ is given, which $V = \{(x, y) : 1 \le x, y \le 2,000,000,000; x, y \in \mathbb{Z}\}$ and $E = \{\}$ initially. You're task is to write a program that support operation x_1, y_1, x_2, y_2, c:

- First, add some edges in G. You should add an edge between (a_1, b_1) and (a_2, b_2) with weight c if $x_1 \le a_1$, $a_2 \le x_2$, $y_1 \le b_1$, $b_2 \le y_2$ and $|a_1 - a_2| + |b_1 - b_2| = 1$.

- Second, calculate the maximum spanning forest of G after edges added.

Input

The first line of input contains an integer T indicating the total number of test cases.

The first line of each test case has an integers n, indicating the number of operations. The n lines that follow describe the operations. Each of these lines has 5 integers x_1, y_1, x_2, y_2, c, separated by a single space.

Limitations:

- $1 \le T \le 500$

- $1 \le n \le 100$

- $1 \le x1 \le x2 \le 2,000,000,000$

- $1 \le y1 \le y2 \le 2,000,000,000$

- $1 \le c \le 1,000,000,000$

- There are at most 20 testcases with $n > 50$.

Output

For each operation, output a number in a line that indicates the weight of maximum spanning forest $\mod 10^9 + 7$.

Sample Input

```
2
3
2 2 3 3 1
1 2 2 3 2
1 1 1 3 5
1
1 1 2000000000 2000000000 1000000000
```

Sample Output

```
3
8
16
999998642
```
